## Executive Summary

This is an updated report following the discovery of data formatting that produced erroneous results. Since PAVER is unable to look backward in time the start date used was January 1, 2025. Also, True Area was applied producing greater accuracy but different results.

The nation's roadway system represents an investment of trillions of dollars by local, state, and federal governments. To protect its investment, the City of Upland hired Transmap Corporation to assist in the development of a Network Pavement Management program. This program is designed to assist in the preservation and extending of the useful life of its paved surfaces throughout the region by optimizing the available funds to meet the road network needs.

Upland maintains approximately 191.64 centerline miles of asphalt paved roads, as well as 37.31 miles of paved Alleys and 25 parking lots. This represents an investment of roughly \$557.4M, based on the city's replacement (reconstruction) costs, with a "fix-all" cost of \$160.4M (See Tables 13 through 15).

Transmap utilizes PAVER (ver. 7.1) to perform road analysis. PAVER, a pavement management system (PMS), is a decision-making tool for the development of cost-effective maintenance and repair alternatives for roads and streets. Developed and maintained by the US Army Corps of Engineers Research and Development Center, it provides a Network-Level, systematic approach to pavement management to ensure optimum return on investment.

PAVER employs a Pavement Condition Index (PCI) condition rating for each segment of roadway (intersection to intersection) in its assessment, on a 0 (Failed) to 100 (Excellent) scale. The inspection criteria and PCI determination are governed by ASTM Standard D6433-11, "Standard Practice for Roads and Parking Lots Pavement Condition Index Surveys" making it an objective and, just as important, repeatable means of assigning a condition rating to the roadways.

On January 31, 2024, a (Boot Camp) meeting was held to begin the process of gathering the necessary information to produce a Pavement Management System (PMS) report. Details regarding costs and budgets were established in preceding discussions and emails.

The City has four (4) district boundaries and four (3) Roadway families, Arterials, Collectors, and Local roads. It also has asphalt Alleys and Parking Lots analyzed separately. The report covers a 5-year plan with a start date of July 1, 2024. A given annual budget of \$6.38M is provided and split between road families by area, as well as a \$350K Budget for Alleys. There is no given budget for Parking Lots.

The city provided 5 years of maintenance history which was not enough to develop individual Pavement Performance Models for each family so, one was created based on other local data and industry standard and can be seen in Appendix A of this report.

The following budget scenarios were constructed for each family of the City's roadway network:

- **"Fix-All" Cost**
- **Do Nothing Consequences (PCI at 5 years)**
- **Given \$6.38M Annual Budget Consequences (budget distributed by area)**
- **Annual Budgets to Maintain Existing PCI's**
- **Annual Budgets to Achieve a PCI equivalent to the existing PCI plus 5 points**
- **Annual Budgets to Achieve a PCI of 70**

## 1.0 All Asphalt (AC) Pavements

The following are unit prices for (M&R) treatments that were obtained from discussions during the Boot Camp meeting and preceding correspondence. Transmap translated the information and placed it into the appropriate M&R Category ranges shown in the tables below. The column titled "Expected Result" reflects the expected extended life of the pavement as either experienced by the City or provided by the industry. These treatments and costs were applied uniformly throughout the roadway network.

**Table 1 - Arterial Asphalt Roads - Treatments, PCI Ranges and Costs**

<b>M&amp;R Category</b>	<b>M&amp;R Treatment</b>	<b>Price per Square Yard</b>	<b>Expected Result</b>
<b>Do Nothing (PCI 86 - 100)</b>	Do Nothing	NA	NA
<b>Global (PCI 71 - 85)</b>	Slurry	\$5.40	5 - Year Stabilization
<b>Conventional (PCI 41 - 70)</b>	Overlay	\$54.00	15-years Reset PCI = 100
<b>Rehab &amp; Reclamation (PCI 0 - 40)</b>	FDR	\$85.50	20-years Reset PCI = 100

**Table 2 - Collector Asphalt Roads - Treatments, PCI Ranges and Costs**

<b>M&amp;R Category</b>	<b>M&amp;R Treatment</b>	<b>Price per Square Yard</b>	<b>Expected Result</b>
<b>Do Nothing (PCI 86 - 100)</b>	Do Nothing	NA	NA
<b>Global (PCI 56 - 85)</b>	Slurry	\$4.50	5 -year Stabilization
<b>Conventional (PCI 41 - 55)</b>	Overlay	\$36.00	20-years Reset PCI = 100
<b>Rehab &amp; Reclamation (PCI 0 - 40)</b>	FDR	\$63.00	25-years Reset PCI = 100

It is important to note that PAVER is designed to optimize the application of the treatments and determine a levelized budget based on treatment costs, the existing conditions, and the deterioration model. Its methodology is not a worst-first approach but instead assigns treatments in a manner that may not be intuitively obvious or operationally convenient, such as grouping roads together for letting.

**Table 3 - Local Asphalt Roads - Treatments, PCI Ranges and Costs**

<b>M&amp;R Category</b>	<b>M&amp;R Treatment</b>	<b>Price per Square Yard</b>	<b>Expected Result</b>
<b>Do Nothing (PCI 86 - 100)</b>	Do Nothing	NA	NA
<b>Global (PCI 56 - 85)</b>	Slurry	\$4.50	5 -year Stabilization
<b>Conventional (PCI 41 - 55)</b>	Overlay	\$36.00	20-years Reset PCI = 100
<b>Rehab &amp; Reclamation (PCI 0 - 40)</b>	FDR	\$63.00	25-years Reset PCI = 100

**Table 4 - Asphalt Alleys - Treatments, PCI Ranges and Costs**

<b>M&amp;R Category</b>	<b>M&amp;R Treatment</b>	<b>Price per Square Yard</b>	<b>Expected Result</b>
<b>Do Nothing (PCI 86 - 100)</b>	Do Nothing	NA	NA
<b>Global (PCI 41 - 85)</b>	Slurry	\$4.50	5 -year Stabilization
<b>Rehab &amp; Reclamation (PCI 0 - 40)</b>	FDR	\$85.50	25-years Reset PCI = 100

**Table 5 - Asphalt Parking Lots - Treatments, PCI Ranges and Costs**

<b>M&amp;R Category</b>	<b>M&amp;R Treatment</b>	<b>Price per Square Yard</b>	<b>Expected Result</b>
<b>Do Nothing (PCI 86 - 100)</b>	Do Nothing	NA	NA
<b>Global (PCI 56 - 85)</b>	Slurry	\$4.50	5 -year Stabilization
<b>Conventional (PCI 41 - 55)</b>	Overlay	\$36.00	20-years Reset PCI = 100
<b>Rehab &amp; Reclamation (PCI 0 - 40)</b>	FDR	\$63.00	25-years Reset PCI = 100

## 1.1 Road Characteristics

The table below illustrates the mileage distribution by surface type, number of miles, number of square yards, and the overall weighted average Pavement Condition Index (PCI).

**Table 6 - Distribution of All Roads by Pavement Type**

<b>Pavement Type</b>	<b># of Sections</b>	<b># of CL Miles</b>	<b>Square Yardage</b>	<b>% by # of SY</b>	<b>Weighted Average PCI</b>
<b>Asphalt</b>	2,210	191.64	4,713,566	100%	57
<b>Total</b>	<b>2,210</b>	<b>191.64</b>	<b>4,713,566</b>	<b>100%</b>	<b>57</b>

**Table 7 - Distribution of Asphalt Roads by Family**

<b>Functional Class/Paver Designation</b>	<b># of Sections</b>	<b># of CL Miles</b>	<b>Square Yardage</b>	<b>% by SY</b>	<b>Weighted Average PCI</b>
<b>Arterials</b>	317	39.8	1,505,619	31.9%	54
<b>Collectors</b>	350	30.17	660,265	14.0%	61
<b>Local Roads</b>	1543	121.67	2,547,682	54.0%	58
<b>Total</b>	<b>2,210</b>	<b>191.64</b>	<b>4,713,566</b>	<b>100.0%</b>	<b>57</b>

**Table 8 - Distribution of Asphalt Roads by District**

Functional Class/Paver Designation	District	# of Sections	# of CL Miles	Square Yardage	% by SY	Weighted Average PCI
<b>Arterials</b>	1	79	8.98	322,627	6.8%	61
	2	85	12.02	438,987	9.3%	61
	3	63	10.82	461,848	9.8%	42

<b>Totals</b>		<b>25</b>	<b>149,031</b>	<b>100%</b>	<b>34</b>

## 2.0 Budget Scenario Details

The following subsections contain various budgeting scenarios for the City’s roadway network. The first is a table summarizing the cost if the City was to “fix all” present deficiencies at once. This is followed by various described scenarios tabularizing and graphically illustrating the annual budgets for 5-year periods, as determined by PAVER, and their resulting year-end PCI.

### 2.1 Fix All Scenarios

**Table 13 – Arterial AC Roads – Fix All**

M&R Category	Centerline Miles	SY	Price per Square Yard	Totals
<b>Do Nothing (PCI 86 - 100)</b>	5.34	202,857	NA	\$0
<b>Global (PCI 71 - 85)</b>	6.83	248,295	\$5.40	\$1,340,793
<b>Conventional (PCI 41 - 70)</b>	15.38	564,518	\$54.00	\$30,483,972
<b>Rehab &amp; Reclamation (PCI 0 - 40)</b>	12.25	489,949	\$85.50	\$41,890,640
<b>Totals</b>	<b>39.80</b>	<b>1,505,619</b>		<b>\$73,715,405</b>

**Table 14 – Collector AC Roads – Fix All**

M&R Category	Centerline Miles	SY	Price per Square Yard	Totals
<b>Do Nothing (PCI 86 - 100)</b>	7.24	151,877	NA	\$0
<b>Global (PCI 56 - 85)</b>	10.85	236,824	\$4.50	\$1,065,708
<b>Conventional (PCI 41 - 55)</b>	4.28	99,350	\$36.00	\$3,576,600
<b>Rehab &amp; Reclamation (PCI 0 - 40)</b>	7.8	172,214	\$63.00	\$10,849,482
<b>Totals</b>	<b>30.17</b>	<b>660,265</b>		<b>\$15,491,790</b>

**Table 15 – Local AC Roads – Fix All**

<b>M&amp;R Category</b>	<b>Centerline Miles</b>	<b>SY</b>	<b>Price per Square Yard</b>	<b>Totals</b>
<b>Do Nothing (PCI 90 - 100)</b>	12.33	258,016	NA	\$0
<b>Global (PCI 70 - 89)</b>	32.08	676,073	\$4.50	\$3,042,329
<b>Conventional (PCI 50 - 69)</b>	59.76	1,239,678	\$36.00	\$44,628,408
<b>Full Depth Reclamation (PCI 0 - 29)</b>	17.49	373,915	\$63.00	\$23,556,645
<b>Totals</b>	<b>121.66</b>	<b>2,547,682</b>		<b>\$71,227,382</b>

**Total Roadway Fix All Cost - \$160,434,405**

**Table 16 – AC Alleys – Fix All**

<b>M&amp;R Category</b>	<b>Centerline Miles</b>	<b>SY</b>	<b>Price per Square Yard</b>	<b>Totals</b>
<b>Do Nothing (PCI 86 - 100)</b>	5.19	36,548	N/A	\$0
<b>Global (PCI 56 - 85)</b>	14.15	99,608	\$4.50	\$448,236
<b>Rehab &amp; Reclamation (PCI 0 - 40)</b>	18.00	126,690	\$85.50	\$10,831,995
<b>Totals</b>	<b>37.34</b>	<b>262,846</b>		<b>\$11,280,231</b>

**Table 17 – Parking Lots – Fix All**

<b>M&amp;R Category</b>	<b>SY</b>	<b>Price per Square Yard</b>	<b>Totals</b>
<b>Do Nothing (PCI 90 - 100)</b>	9,945	NA	\$0
<b>Global (PCI 70 - 89)</b>	8,139	\$4.50	\$36,626
<b>Conventional (PCI 50 - 69)</b>	50,306	\$36.00	\$1,811,016
<b>Full Depth Reclamation (PCI 0 - 29)</b>	80,641	\$63.00	\$5,080,383
<b>Totals</b>	<b>149,031</b>		<b>\$6,928,025</b>

## 2.2 Do Nothing Scenarios

The following scenarios display the predicted PCI results, over the 5-year planning period if no maintenance actions are taken.

**Table 18 - Arterial Asphalt Roads - Do Nothing Consequences**

Year Beginning January 2025	Annual Budget (Major)	PCI at Year End	Deferred Maint.
2025	\$0	53	\$73,200,000
2026	\$0	49	\$80,100,000
2027	\$0	45	\$88,100,000
2028	\$0	41	\$95,600,000
2029	\$0	37	\$103,400,000

**Figure 1. Arterial Asphalt Roads - Do Nothing Consequences**

**Table 19 - Collector Asphalt Roads - Do Nothing Consequences**

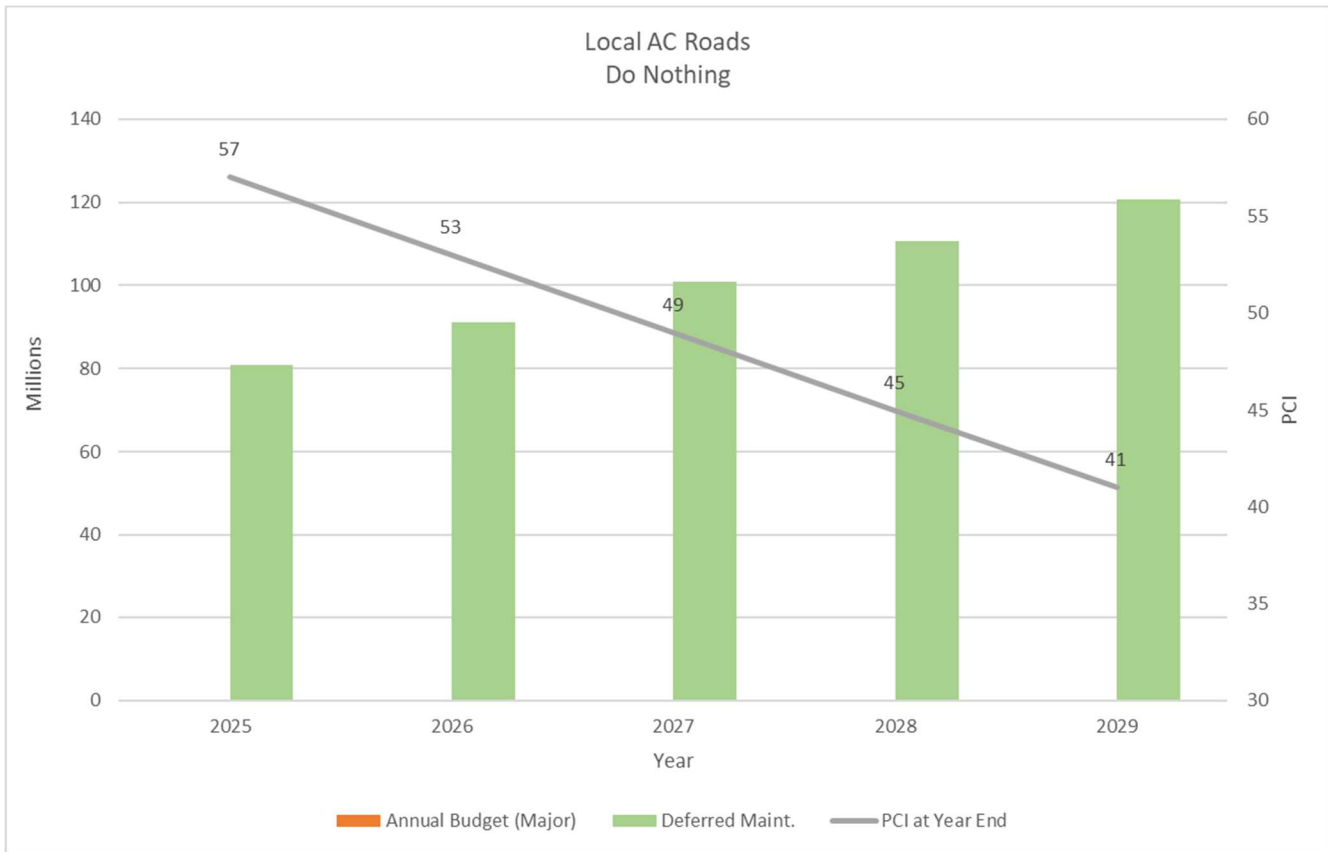

Year Beginning January 2025	Annual Budget (Major)	PCI at Year End	Deferred Maint.
2025	\$0	60	\$20,300,000
2026	\$0	56	\$22,900,000
2027	\$0	52	\$24,700,000
2028	\$0	48	\$26,600,000
2029	\$0	44	\$29,800,000

**Figure 2. Collector Asphalt Roads - Do Nothing Consequences**

**Table 20 - Local Asphalt Roads - Do Nothing Consequences**

<b>Year Beginning January 2025</b>	<b>Annual Budget (Major)</b>	<b>PCI at Year End</b>	<b>Deferred Maint.</b>
<b>2025</b>	\$0	57	\$80,800,000
<b>2026</b>	\$0	53	\$91,200,000
<b>2027</b>	\$0	49	\$101,000,000
<b>2028</b>	\$0	45	\$110,600,000
<b>2029</b>	\$0	41	\$120,600,000

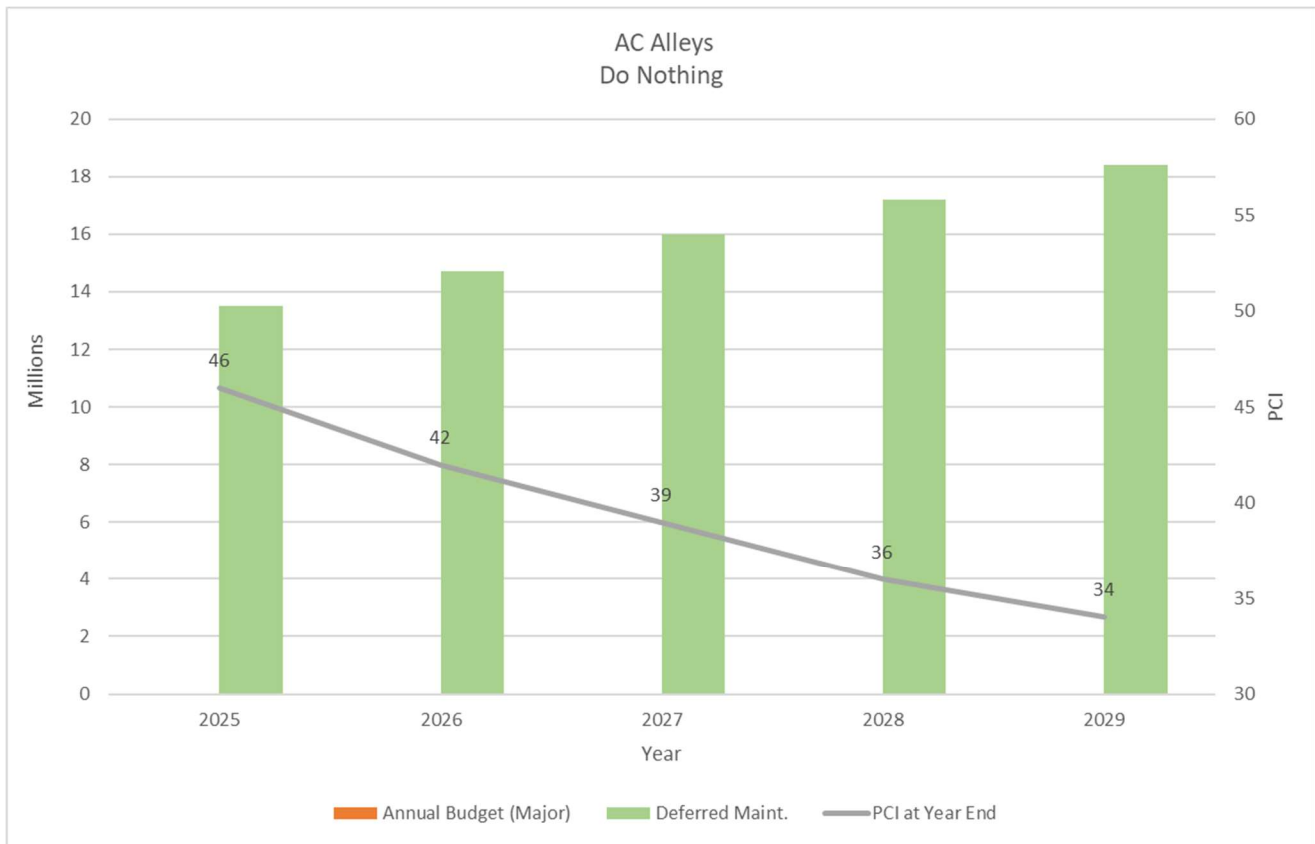

**Figure 3. Local Asphalt Roads - Do Nothing Consequences**

**2029 Asphalt Roadway Network PCI = 40**

**Table 21 - Asphalt Alleys - Do Nothing Consequences**

Year Beginning January 2025	Annual Budget (Major)	PCI at Year End	Deferred Maint.
2025	\$0	46	\$13,500,000
2026	\$0	42	\$14,700,000
2027	\$0	39	\$16,000,000
2028	\$0	36	\$17,200,000
2029	\$0	34	\$18,400,000

**Figure 4. Asphalt Alleys - Do Nothing Consequences**

**Table 22 - Asphalt Parking Lots - Do Nothing Consequences**

<b>Year Beginning January 2025</b>	<b>Annual Budget (Major)</b>	<b>PCI at Year End</b>	<b>Deferred Maint.</b>
<b>2025</b>	\$0	33	\$8,100,000
<b>2026</b>	\$0	28	\$8,400,000
<b>2027</b>	\$0	23	\$8,900,000
<b>2028</b>	\$0	18	\$9,300,000
<b>2029</b>	\$0	13	\$9,600,000

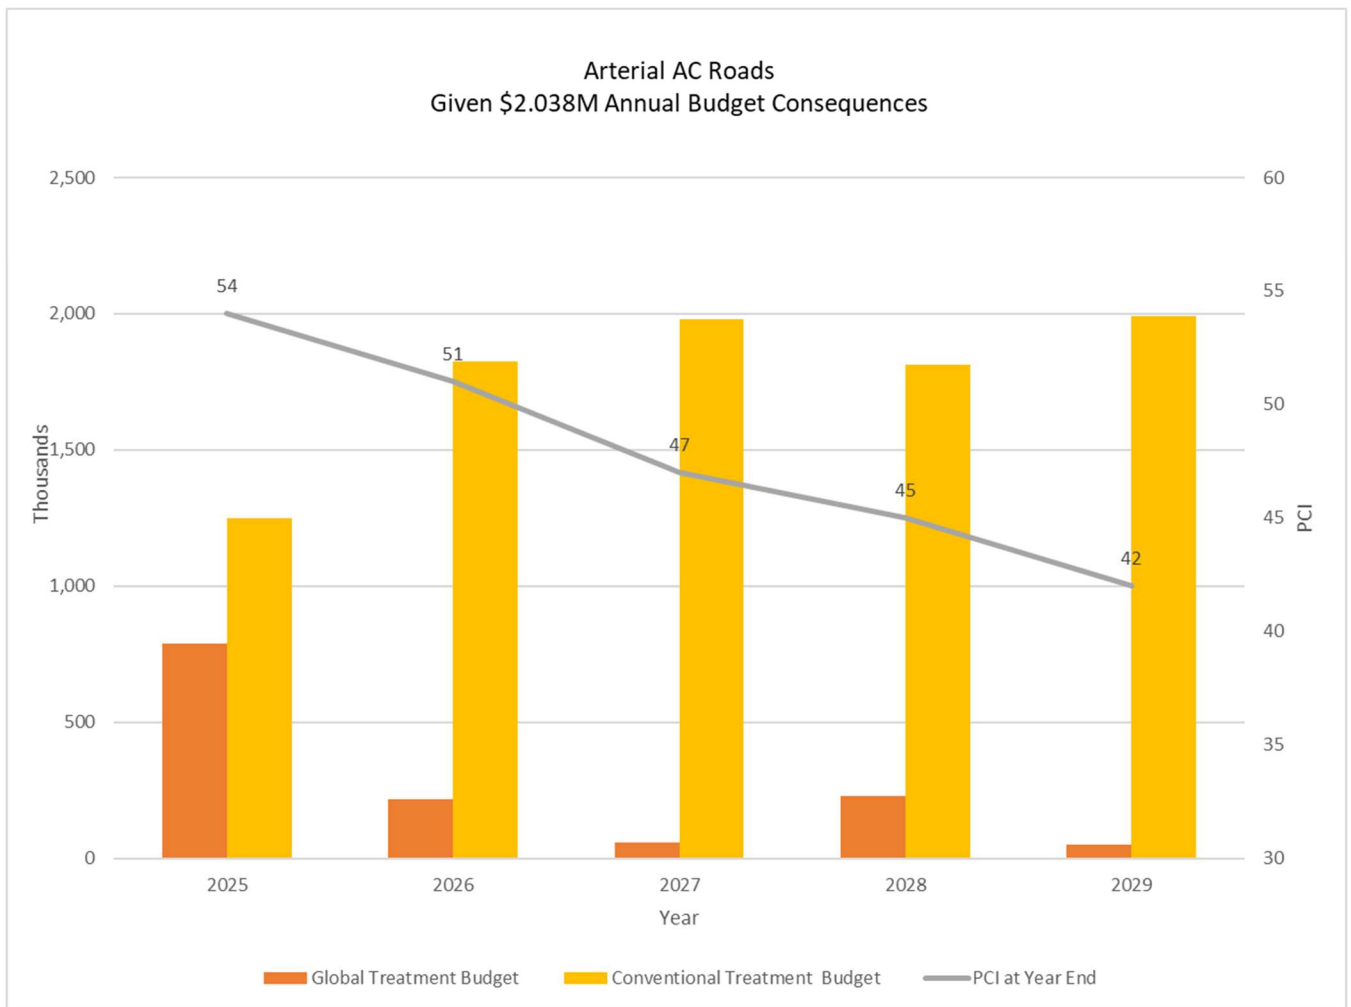

**Figure 5. Asphalt Parking Lots - Do Nothing Consequences**

### 2.3 Given Annual Budget Consequence Scenarios

The Given budget of \$6.38M was divided between each roadway family based on their total SY areas resulting in Arterials - \$2.038M, Collectors - \$894K, and Local - \$3.448M.

**Table 23 - Arterial Asphalt Roads – Given \$2.038M Annual Budget Consequences**

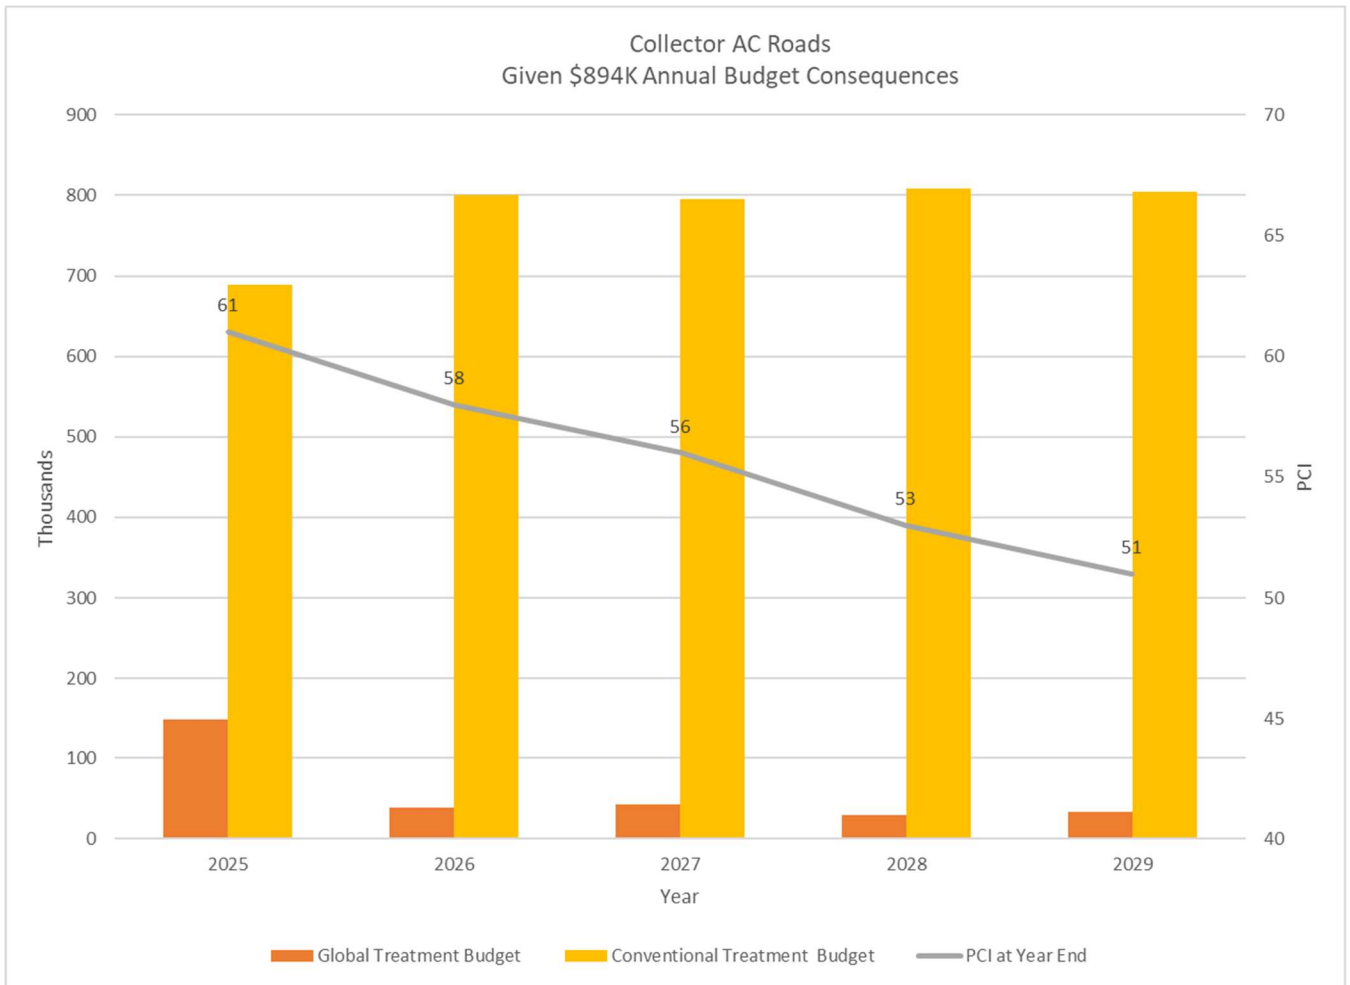

Year Beginning January 2025	Global Treatment Budget	Conventional Treatment Budget	PCI at Year End	Deferred Maint.
2025	\$788,000	\$1,250,000	54	\$71,100,000
2026	\$216,000	\$1,822,000	51	\$76,000,000
2027	\$58,000	\$1,980,000	47	\$80,500,000
2028	\$228,000	\$1,810,000	45	\$85,100,000
2029	\$49,000	\$1,989,000	42	\$90,400,000

**Figure 6. Arterial Asphalt Roads – Given \$2.038M Annual Budget Consequences**

## Appendix A - Asphalt Pavement Performance Curve

The predictive modeling (family modeling) process groups pavements of similar construction that are subjected to similar traffic loads, weather, and other factors that affect pavement life. The historical data on pavement condition can be used to build a model which can predict the future performance of a group of pavements with similar attributes. In PAVER, this model of a pavement's life is referred to as a "family."

The performance curve plays a key role in the development of network-level budget analysis. If the deterioration rate of the curve is too steep, the required budget to repair these pavements will increase. If the deterioration rate of the curve is too flat, the required budget to repair these pavements will be too small. Both situations are erroneous, but when analyzing over a brief period, like 5 years, the change at any point over that period needs only be close initially. Constructing models that can accurately predict the performance of any road is an iterative process that is refined from the results of multiple condition surveys. Historical maintenance data are useful but can be initially misleading because they will contain many outliers particularly if the data are not being collected specifically for this purpose.

Figure A-1 below shows the results from the asphalt performance model developed for the City for Arterial/Collector and Local roads.

**Figure A.1. All Roads - Pavement Performance Curve as translated by PAVER and its polynomial.**

## Appendix B - Pavement Condition Index (PCI) Formula

**Step 1:** In a Network Level PMS, a survey of a limited number of sample units per section is sufficient. A sample area is defined as an area of 2,500 square feet plus or minus 1,000. A section is viewed as the smallest management unit when considering the application and selection of maintenance and repair (M&R) treatments.

$$PCI_s = PCI_r = \frac{\sum_{i=1}^R PCI_{ri} \times A_{ri}}{\sum_{i=1}^R A_{ri}}$$

Where

$PCI_s$  = PCI of a pavement section

$PCI_r$  = area weighted average PCI of random (or representative) sample units

$PCI_{ri}$  = PCI of random sample unit number  $i$

$A_{ri}$  = area of the random sample unit  $i$

$R$  = total number of inspected random sample units

**Step 2:** If additional sample units are inspected, they can be used to enhance the section PCI as follows:

$$PCI_a = \frac{\sum_{i=1}^A (PCI_{ai} \times A_{ai})}{\sum_{i=1}^A A_{ai}}$$

$$PCI_s = \frac{PCI_r(A_s - \sum_{i=1}^A A_{ai}) + PCI_a \times \sum_{i=1}^A A_{ai}}{A_s}$$

$PCI_a$  = area weighted average PCI of additional sample units

$PCI_{ai}$  = PCI of additional sample unit number  $i$

$A_{ai}$  = area of additional sample unit  $i$

$A_s$  = total section area

**Step 3:** Using customer-defined constraints, such as the desired level of service, available rehabilitation technologies, or budgets, paving plans are developed in the Pavement Management System.

# Appendix C - Principles of Pavement Management

Given the persistent shortage of funding for maintaining street systems, the most efficient means of maximizing the return on investment for road maintenance is to implement a Pavement Management System.

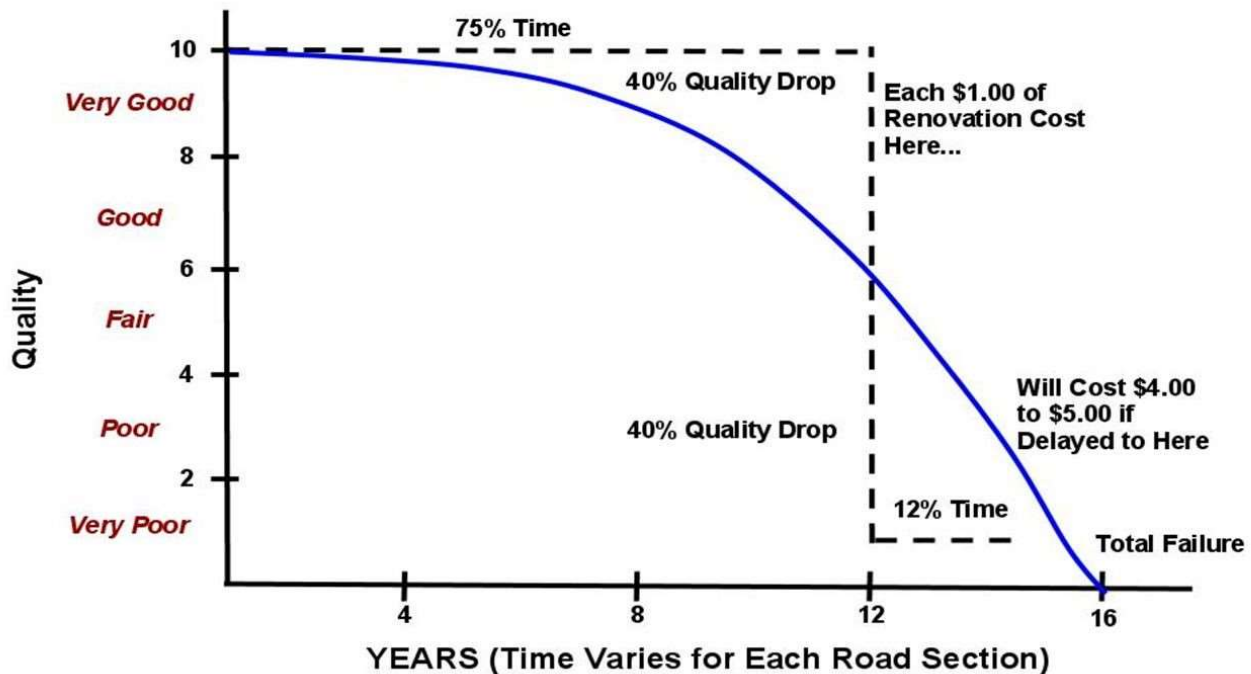

Pavement management is a systematic approach to maximizing the life of a pavement network while optimizing the use of constrained funding encompassing planning, budgeting, funding, designing, constructing, monitoring, evaluating, maintaining, rehabilitating and reconstructing a pavement network.

A Pavement Management System assists in finding and implementing the best Maintenance & Rehabilitation (M&R) strategies. Intuitively, we know that repairing streets when they are still in fair condition costs less over their lifetime than waiting to fix roads that have fallen into poor condition and extensive research over the years has proven this to be true. A proactive approach of routine pavement management means less money wasted on roadway reconstruction and a potential savings of millions of dollars.

This process is illustrated below. It details how timely intervention can delay the inevitable total reconstruction for as long as practical. If repairs are delayed until a road is rated in "Fair" condition or worse, the cost of rehabilitation becomes 4 to 5 times more expensive than for those roads in "Good" condition. This means without preventative pavement maintenance; the cost of rehabilitation will be prohibitively expensive.

## Asphalt Pavement Deterioration

COST OF 'TIMELY' MAINTENANCE

A Pavement Management System also provides a way to store an accurate inventory of all roadways, enriched with links to easements, as-built records, and historical documentation. The breadth and depth of information they hold, including digital images of roadways, baseline pavement condition data, and reviews of deterioration over time, are invaluable resources for measuring and tracking the effectiveness of Maintenance and Rehabilitation strategies.

Successful pavement management system programs let agency decision-makers develop reliable performance models for the roadway, which can be used to generate sound policies and long-term rehabilitation strategies, budgets, and timetables.

Another compelling reason for implementing a Pavement Management System is the Governmental Accounting Standards Board (GASB) Statement 34. This regulation requires agencies that collect taxes to manage a long-term, fixed infrastructure asset to either:

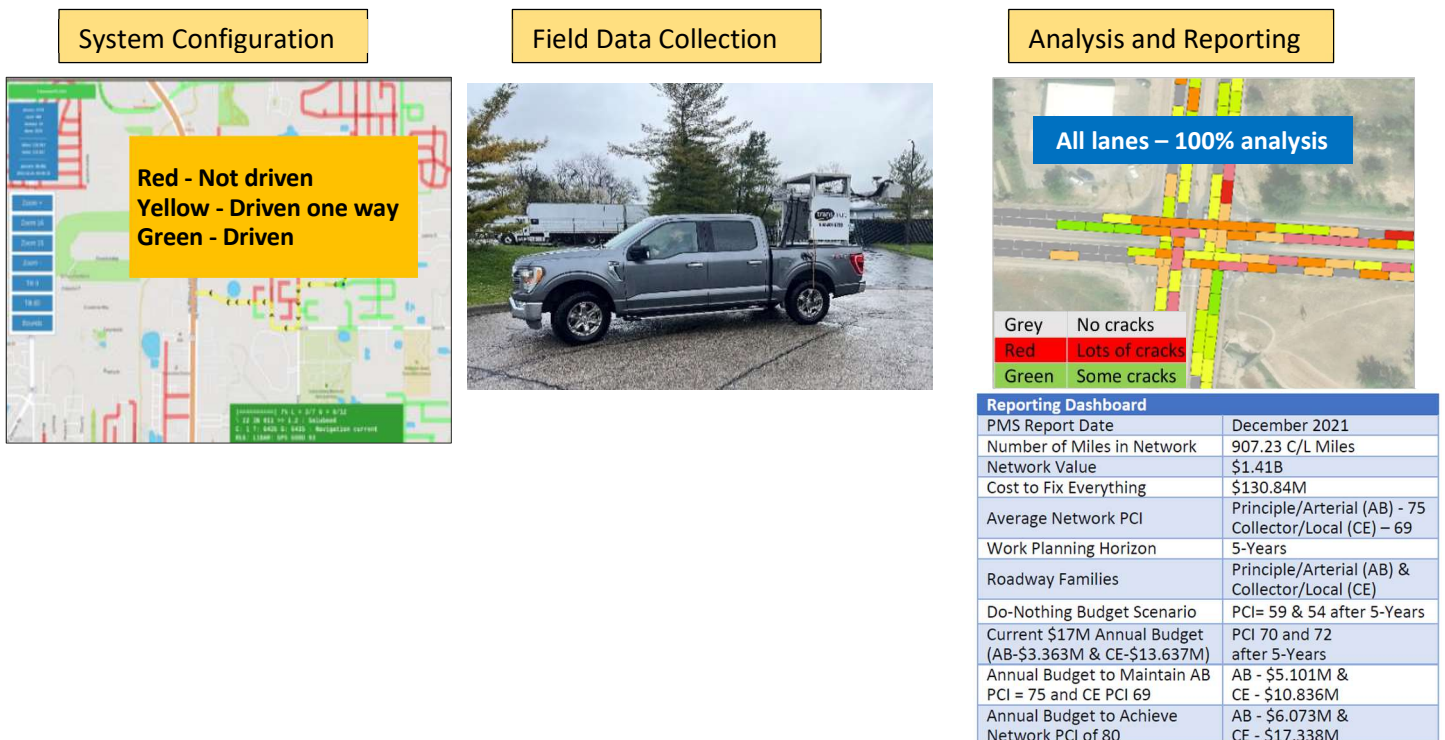

- **Option #1** - Implement financial accounting controls to effectively depreciate and plan for the replacement of fixed assets.
- **Option #2** - Implement an asset management system that provides a mechanism to gauge and budget for the long-term rehabilitation and/or maintenance of assets.

This study completed on the roadway network can be used as the basis for achieving GASB 34\*\* compliance, either as the foundation for the inventory and valuation of the network (Option #1) or as the foundation of an asset management system (Option #2).

\*\*Although it is not required to meet GASB 34 standards, it is recommended to follow the industry's best practices regarding monitoring their infrastructure.

## The Pavement Management Process

The figure below depicts the three unique, but equally important, steps that comprise the Pavement Management Process.

**1. System Configuration**

System configuration involves identifying all roadways of the project network and assigning them a unique identifier. Each section has attributes such as physical characteristics (length, width, etc.), pavement type, and road classification. As part of system configuration, the network is linked to a GIS map. This map is loaded into our web-based mapping system.

**2. Field Data Collection**

After system configuration is completed, every roadway and all lanes in the system are surveyed and its condition is assessed using the following criteria:

**Surface Distress**

We use a Laser Crack Measurement System (LCMS4m) 3D pavement imaging technology. Pavement surface distresses, including alligator cracking, block cracking, rutting, raveling, reflective cracking, loss of section, bleeding, edge distress, and patched areas, as well as right of way (ROW) imagery will be collected on a segment-by-segment basis, with each distress captured by type, extent, and severity.

**Table 1**, with respect to the pavement type (AC=Asphalt Pavement and PCC=Portland Cement Concrete).

**Description of Surface Distresses Recorded by Transmap**

**Pavement Distresses for Asphalt Pavement**

<p><b>Alligator Cracking</b>  <b>Block Cracking</b>  <b>Bleeding</b>  <b>Edge Cracking</b>  <b>Transverse and Longitudinal Cracking</b></p>	<p><b>Patching and Utility Cut Patching</b>  <b>Potholes</b>  <b>Rutting</b>  <b>Weathering</b>  <b>Raveling</b>  <b>Bumps and Sags, Corrugations and Depressions</b></p>

**Pavement Distresses for Concrete Pavement**

<p><b>Divided Slabs</b>  <b>Linear Cracking</b>  <b>Corner Breaks</b>  <b>Durability (“D”) Cracking</b>  <b>Faulting</b>  <b>Joint Seal Damage</b></p>	<p><b>Pop Outs</b>  <b>Pumping</b>  <b>Scaling or Map Cracking</b>  <b>Shrinkage Cracking</b>  <b>Corner or Joint Spalling</b>  <b>Small or Large Patching</b></p>
----------------------------------------------------------------------------------------------------------------------------------------------------------------------------	----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Detailed descriptions of pavement distress and severity can be found in ASTM D6433-11.

**Severity**

Once distress has been identified, its severity (Low, Moderate, High) is attached to the appropriate record and its count, e.g., the number of potholes, square footage (area covered by cracking), or linear feet (length of a specific crack) are added as well.

In a Network Level PMS, a survey of a limited number of sample units per section is sufficient. A sample area is defined as an area of 2,500 square feet plus or minus 1,000. A section is viewed as

the smallest management unit when considering the application and selection of maintenance and repair (M&R) treatments. All field survey data collected in samples are summarized on a section-by-section basis. Each section constitutes a unit of data to populate the Pavement Management System.

Other data collected during field surveys include the pavement width, the pavement type, GPS coordinates, and digital images.

### 3. Analysis and Reporting

The results of a Pavement Management System analysis provide a quantitative performance score called Pavement Condition Index (PCI).

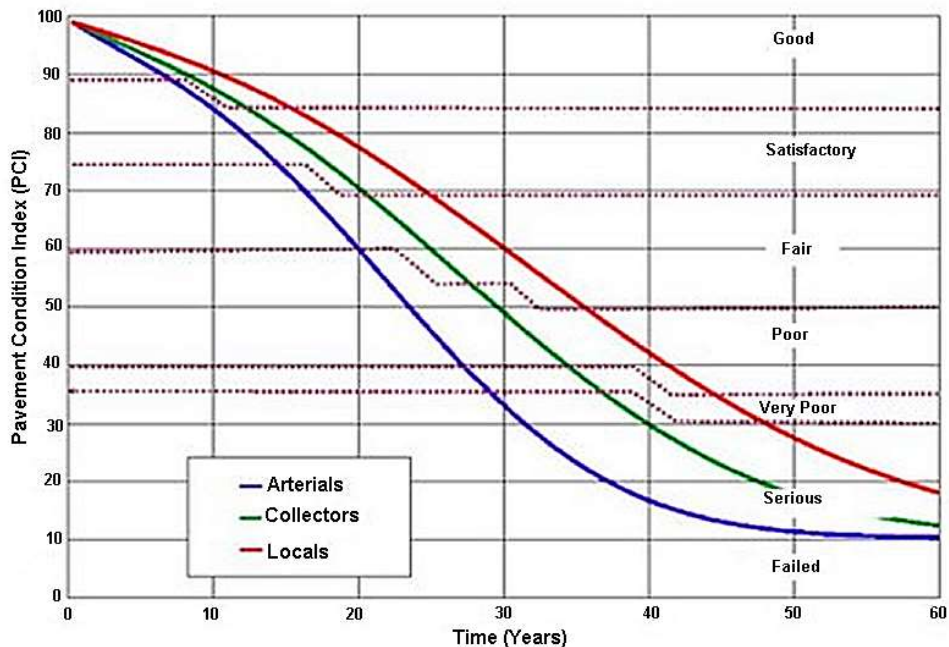

Pavement Condition Index (PCI) is an engineering terminology representing the surface condition of the pavement on a scale of 0 to 100. For example:

- PCI of 100 is a pavement in perfect condition.
- PCI of 0 is a pavement that is destroyed.

The PCI is a distress-based condition index, i.e., specific distresses in the pavement are identified and tallied, and the type, severity, and extent of each distress are used to calculate a single number representing the pavement condition. The higher numbers reflect better pavement. The formula used to calculate the PCIs is in **Appendix B**.

All condition ratings of the field surveys are captured at sample areas and combined to calculate one value, which represents the PCI of a pavement section using the area weighted average.

## Understanding the Pavement Condition Index

**Understanding the Pavement Condition Index Score**

The following illustration shows how the Pavement Condition Index (PCI) deteriorates over time for three different types of roadways. It also compares the PCIs to commonly used descriptive terms (Good, Satisfactory, Fair, Poor, Very Poor, Serious, Failed). The divisions between the descriptive terms are not fixed but are meant to indicate common perceptions of roadway conditions.

An industry-standard defines the different PCI condition levels with respect to the remaining life of a pavement and typical rehabilitation options recommended.

**Industry Standard for PCI Condition Levels**

<b>PCI Range</b>	<b>Work Type</b>	<b>Rehabilitation Options</b>
<b>86-100 Good</b>	<b>Rejuvenation</b>	<b>Little or no maintenance E.g., Crack Seal, Reclimite, fog seal</b>
<b>71-85 Satisfactory</b>	<b>Global</b>	<b>Routine Maintenance, e.g., Seals such as slurry seal</b>
<b>56-70 Fair</b>	<b>Critical</b>	<b>Non-structural overlay, cape seal</b>
<b>41-55 Poor</b>	<b>Conventional</b>	<b>Structural Overlay Overlay or Mill &amp; overlay</b>
<b>26-40 Very Poor</b>	<b>Conventional</b>	<b>Structural Overlay Overlay or Mill &amp; overlay</b>
<b>11-25 Serious</b>	<b>Reconstruction</b>	<b>Reconstruction, rebuild, full depth reclamation</b>
<b>0-10 Failed</b>	<b>Reconstruction</b>	<b>Reconstruction, rebuild, full depth reclamation</b>

**Maintenance and Rehabilitation Planning**

**Key Analysis Inputs**

All Pavement Management Systems require user input to establish budget estimates and pavement Maintenance & Rehabilitation (M&R) plans. During the Boot Camp, decisions were made that affected the pavement rehabilitation program in a variety of ways. The key inputs are:

- The M&R pavement preservation categories
- The M&R pavement treatment type
- The PCI ranges are assigned to the M&R categories.
- The Critical PCI
- Unit cost for each pavement treatment type
- Expected life of the treatment type
- Agency budget and length of the planning period
- Budget required to achieve a target PCI at the end of the planning period.
- Desired deferred maintenance at the end of the planning period

## Pavement Preservation

The figure below represents the American Public Works Association (APWA) industry-standard pavement preservation curve.

The figure below represents APWA's Pavement Toolbox. This toolbox looks at preservation treatments and how they are cost-effective to use as opposed to spending all funding on worst-first maintenance (rehabilitation/reconstruction).

This hierarchical strategy ensures that roadways slated for reconstruction remain in the reconstruction pipeline even if there is a funding shortfall. Available funds are used to preserve those streets that can be treated with slurries and overlays. No real equity is lost when those roads become unacceptable for use since they were already scheduled for reconstruction.
